

## How to transfer huge files

We've all had to send image files to friends or family only to ending up sending multiple emails to stay under the files size limits, or you end up sending reduced size files that don't impress.

Let me introduce a **FREE** service named [wetransfer.com](https://wetransfer.com). Wetransfer allows you to upload large (and small) files and then send a link to recipients. They receive a link that allows them to download the files. The free service has a 2G limit per upload.

Here's how it works, go to <https://wetransfer.com> and you'll get this:

Fill in a recipient's email address

Now click the Add your files and select the files, [wetransfer.com](https://wetransfer.com) creates a link and uploads your files. You can also add a message. Then press Transfer.

The recipient receives a link to the files. They click the link and the files download to their computer. CAUTION: the link has a limited life, it's good for a week or so.

So, the next time you want to send in your favorite images from the last outing, try [wetransfer.com](http://wetransfer.com) and send me full size images
